- Single stream economics processing costs, commodity revenue
- Single stream processing agreements common elements

Single Stream Recycling

Single-stream recycling is a system in which all recyclables are placed in a single bin or cart for recycling.

These recyclables are collected by a single truck and taken to a Materials Recovery Facility (MRF) to be sorted into various commodity streams for sale to markets.

The materials are then further processed into feedstock which can be used in the manufacture of new products.

What goes in the recycling bin...

- Cardboard
- Containerboard
- Newspaper
- Magazines
- Office paper
- Junk mail
- Envelopes
- File folders
- Phone books

- Plastic #'s 1-7
- Water bottles
- Glass (clear, green, brown)
- Steel & tin cans
- Aluminum
- Aseptic packaging

 Milk cartons
 Juice boxes
 - o Soup containers

Recycling Processing Facilities

Recycling Processing Facilities

- Trucks collect single stream recyclables and take them to a processing facility called a material recovery facility or "MRF."
- MRF's use various combinations of machinery and manual labor to separate the items and create the highest value, sale-able, raw materials.
- Raw materials are then sent to manufacturers to be made into new products.

Common MRF Elements

- Every MRF is different.
- Each has a tipping floor to accept unsorted materials and a warehouse to ship sorted materials.
- The layout progresses from a gross sort to a fine sort.
- Manual sorting or human intervention is required at one or more stages of the process.
- One or more horizontal balers is utilized to compress the materials in preparation for sale.

The unique layout of a MRF and the specific components included are based on:

- Volume
 - Lower volume = less technology & lower productivity (cost balancing)
- Composition
 - Components are selected to accommodate the highest percentages of materials in the stream.
- Goals

o Budgetary, tons per hour, automation, cost per ton, etc.

The layout progresses from a gross sort to a fine sort:

- 1. Pre-sort (removes large items & non-recyclables)
- 2. Cardboard (OCC) screen
- 3. Containers separated from fiber
 - 1. Fibers sorted by grade
 - 1. Mixed Paper
 - 2. Office Paper
 - 3. Paperboard
 - 4. Cardboard
 - 2. Containers sorted by type
 - 1. PET
 - 2. HDPE-Natural
 - 3. HDPE Colored
 - 4. Mixed #3-7
 - 5. Steel cans
 - 6. Aluminum
- 4. Glass and residual removed at various points

MRF Video

Demonstration Video of MRF

Commodity Pricing, Markets & Market Dynamics

Finished Product

The end result of all sorting at the MRF is separated commodities ready for market.

Commodity Specification

- Before a sale can be made from the MRF to a buyer, each bale must meet industry and buyer specifications for that material type and grade.
- Specifications can include:
 - restrictions on contaminants (anything other than the material grade)
 - material quality
 - bale size and weight
 - trailer loading requirements
 - photo documentation
- Examples: ISRI, GP, Evermore, SP

Once recyclables have been sorted, they can be sold to:

- a broker
- another processor who might further prepare the items for remanufacturing by cleaning or grinding
- to mills or other companies that use them directly in the manufacturing process.

Recyclable materials are commodities whose value fluctuates based on market conditions. Each commodity is associated with a published price index that determines its actual sales price on a weekly or monthly basis.

What influences commodity price?

Supply & Demand

- Global
 - o China's historical role in the recycling industry
 - o "Operation Green Fence"
 - Post-Green Fence & the rise of Mexico & India
- US Regional
 - o Mill/manufacturer location
 - Proximity to forests
 - o Transportation hubs
- Local
 - o Mill/manufacturer location
- 2017 National Sword Policy

Economics of virgin vs. recycled

Fiber Pricing

- Marketplace Dynamics
 - o Supply-Demand
 - End user and/or mill processing capabilities
 - Distance from export hubs
 - o Quality
- Pricing Indices
 - Recovered fiber is a commodity: price based on a published index.
 - Most common = Pulp and Paper Week
 - Published monthly on or around the 5th.
 - Prices by grade and geographical region
 - High and low side for each grade.
 - o Purchase price and rebates are generally based on the index price.

Fiber Price Index: Pulp and Paper Week

PRICE WATCH: Recovered Paper - Domestic

US\$ per short ton for open market purchases by mills; FOB seller's dock, for delivery this month. (Further specifications below.)

Aluminum (UBC), Steel, PET, HDPE, Mixed Plastics, Glass, Film, etc.

- Strict quality requirements
- Not as rigidly tied to a specific index
 Local prices can vary widely
- More sensitive to <u>all</u> market dynamics
 - Buyers & processors can be more volatile and will make expedient changes to maximize profit

Single Stream Economics

- The income of a MRF is generated by the sale of the commodities that are processed at the facility.
- Each MRF has a unique average composition which drives the overall "value" of the stream.
- Income fluctuates each month based on volume produced, volume sold and the price of each commodity type.
- "Revenue-sharing" arrangements also reduce the income generated by a MRF.

Single Stream Composition Value

- Composition is determined by measuring the weight of each individual commodity and then calculating its percentage of the total materials processed over a specific period of time.
- At the end of every month a MRF can calculate (within reason) its total composition based on the finished products sold, finished products in inventory, and residuals (typically "work in progress" materials are not counted".)
- MRF's will also often seek to understand the composition of specific recycling streams for the purpose of determining its overall value or burden to the processing operation.

Composition changes can have a material impact on revenue generation.

In this example, a 0.37% increase in UBC increased the overall stream value up by \$5.93 per ton.

Commodity price changes can have a material impact on revenue generation.

In this example, a \$10.00 increase in the ONP #8 price caused the overall value to increase by \$2.89 per ton.

MRF Operating Costs

Operating costs include:

- Labor
- Fuel
- Repair & Maintenance
- Operating supplies & consumables

- Safety supplies & training
- Utilities
- Insurance costs (accidents & injuries)

All MRF operating costs are variable and can move up or down based on:

- Changes in volume & composition
- Productivity variability
- Equipment downtime
- Repair and maintenance schedules and costs

Consistency is key to stabilizing costs: preventative maintenance, robust safety programs & standards, effective supervision, inbound quality reviews

MRF Operating Profit

	Dol	lars	5	Per Ton Calculation								
	Actual		Budget		Actual		Budget	'	Variance			
Tons Processed	2540		2298									
Gross Revenue	\$ 237,011	\$	273,001	\$	93.31	\$	118.80	\$	(25.49)

MRF's generally operate on tight margins and can be materially impacted by upset conditions.

Changes in volume can cause cost dollars to increase or decrease. To normalize volume fluctuation; unit costing is generally used to evaluate performance.

- MRF income is dynamic and influenced by a number of factors. It can change quickly and frequently.
- MRF's are generally designed to achieve a certain level of productivity (tons per hour) and process a certain number of tons per day/week/month.

Single Stream Processing Agreements

- Various arrangements can exist between owner and operator.
- Agreements must be designed to accommodate significant changes in commodity price and demand.
- The most successful ensure that the operator can remain whole when commodity prices drop – share risk and reward.
- Agreements should be considerate of commitments related to capital investments.

Operator and Supplier

- Operators need regular volume to cover costs and run at peak efficiency.
- Agreements are used to secure chunks of base volume.
- Typical agreements consider the composition of the supplier material and include provisions for initial and periodic composition studies.
- Suppliers pay a processing fee or receive a rebate based on a calculation that considers the monthly value of each commodity and the processing costs (see example)

Operator and Supplier

Commodity	Price Sources	Cur	rent Prices	Composition	1	Value
000	OBM Chicago High +\$10 Mar 5	\$	75.00	8.37%	\$	6.28

Less Processing Fee					\$	(45.73)
Rebate/(Charge) per Ton					\$	4.96
Tons Delivered- estimate						5,500
Total Rebate/Charge)					\$	27,262

- Operators need to be able to move materials on a consistent basis.
- Buyers will enter into agreements with moderate pricing deals to secure volume and will agree to accept materials even when demand drops. ("Spot" buyers offer higher prices but will not buy from noncontracted sources when demand drops).
- Both parties must understand volume commitments, pricing arrangements and quality requirements.

- MRF's are complex operating entities with tangible operating costs.
- MRF income can fluctuate based on volume, quality and commodity prices.
- Commodity markets are dynamic and sensitive to various factors in the global, national, regional and local economy.
- Relationships between owners, operators, suppliers and buyers need to be well thought out and accommodate the variant nature of commodity revenue to ensure long term stability.

Thank You!
