Pedestrian Crash Analysis

7/11/2022

# Agenda

---

- Selection Process
- Key Crash Analysis Findings for Ann Arbor
  - Who?
  - Where?
  - When?
  - Why?

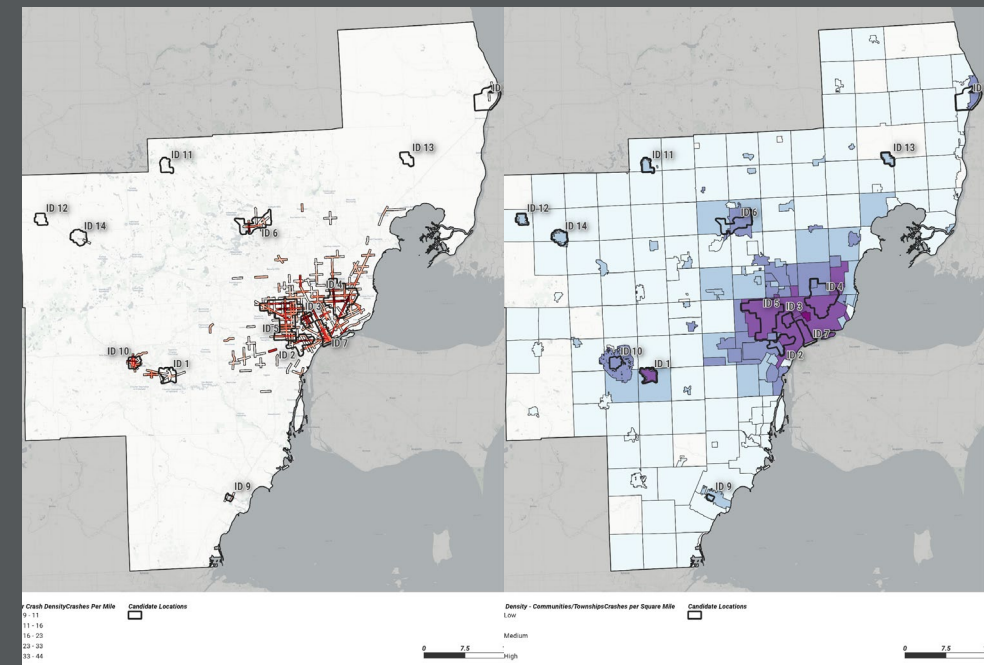

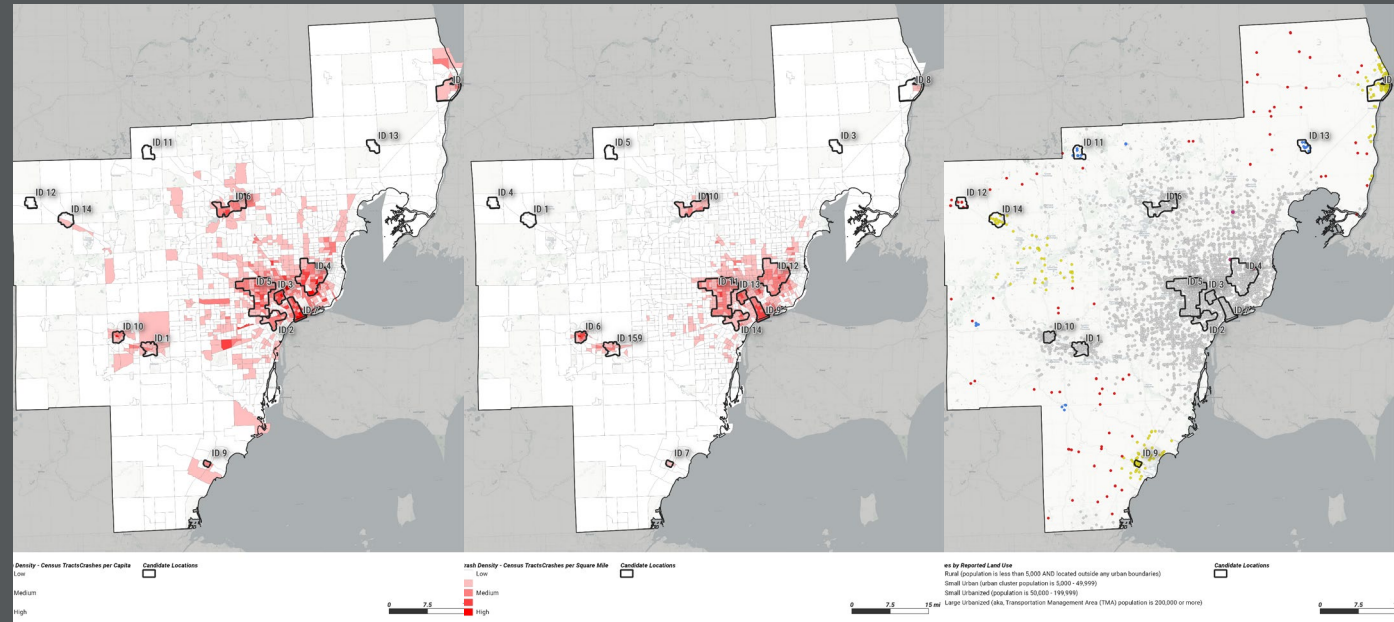

# Selection Process

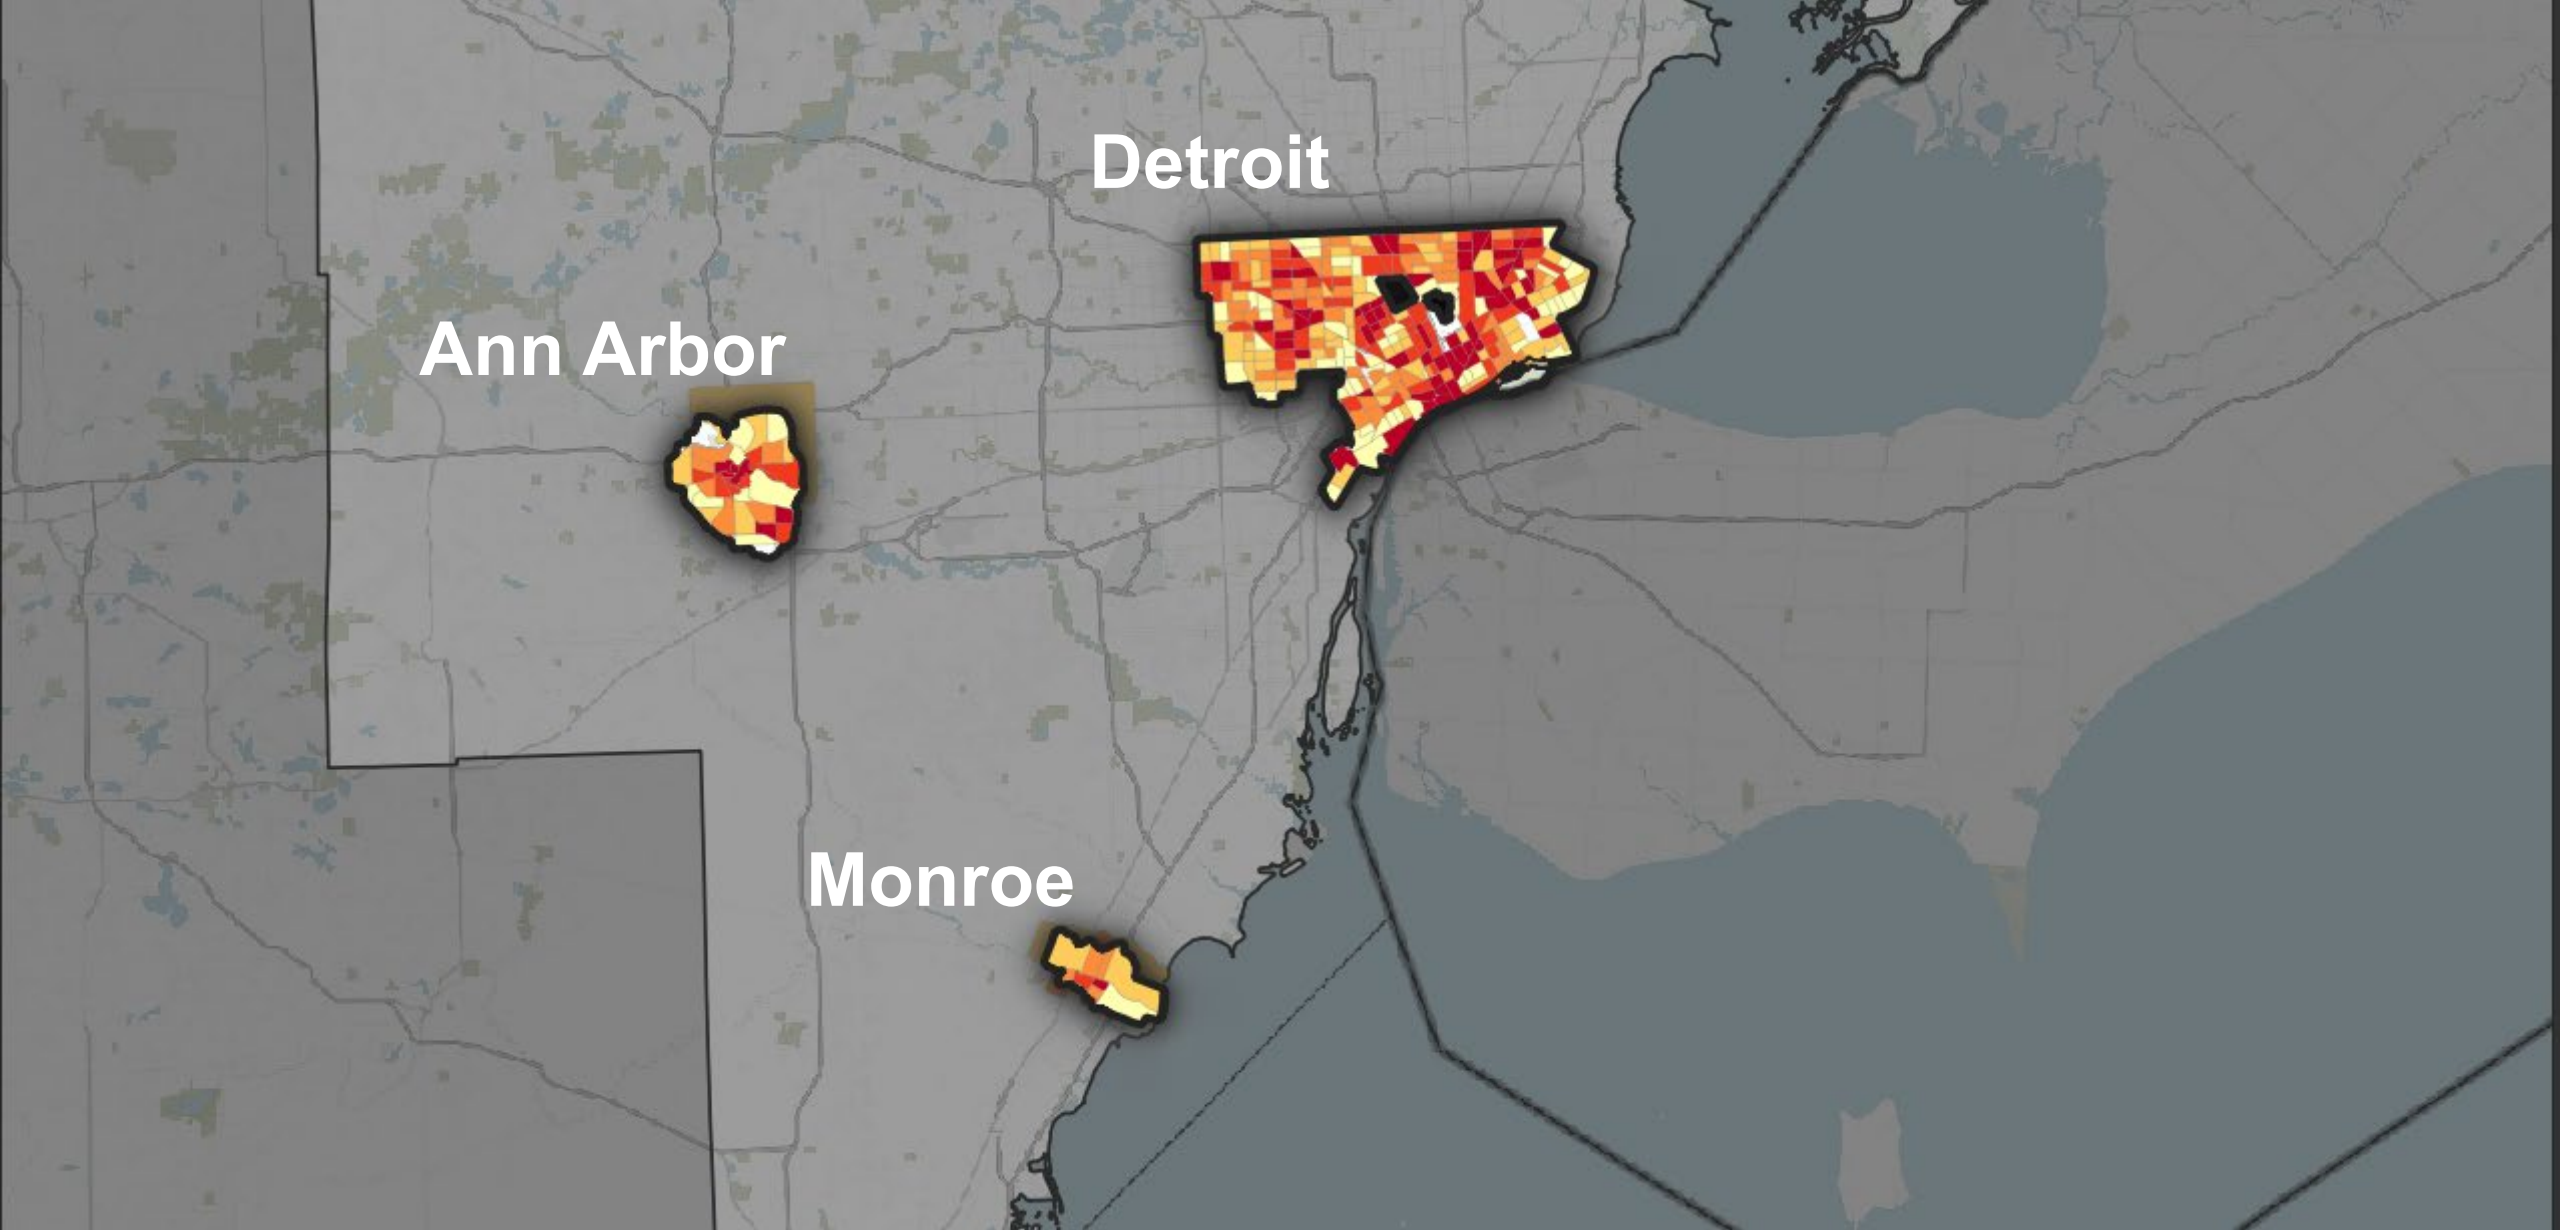

# Candidate Locations

Identified 14 initial locations

Spatial Analyses:

- Crash density per square mile, Census tracts
- Crashes per capita, Census tracts
- Crash density by community/township
- Linear crash density (sliding windows analysis)
- Crashes by reported land use type

Detroit

Ann Arbor

Monroe

# Key Crash Analysis Findings for Ann Arbor

# Focus Communities – Ann Arbor

- Communities with highest weighted crash aggregates
- Ann Arbor 2015-2019.
  - 309 crashes
  - 5 fatal crashes
  - 31 serious injury crashes

# Key Terms and Concepts

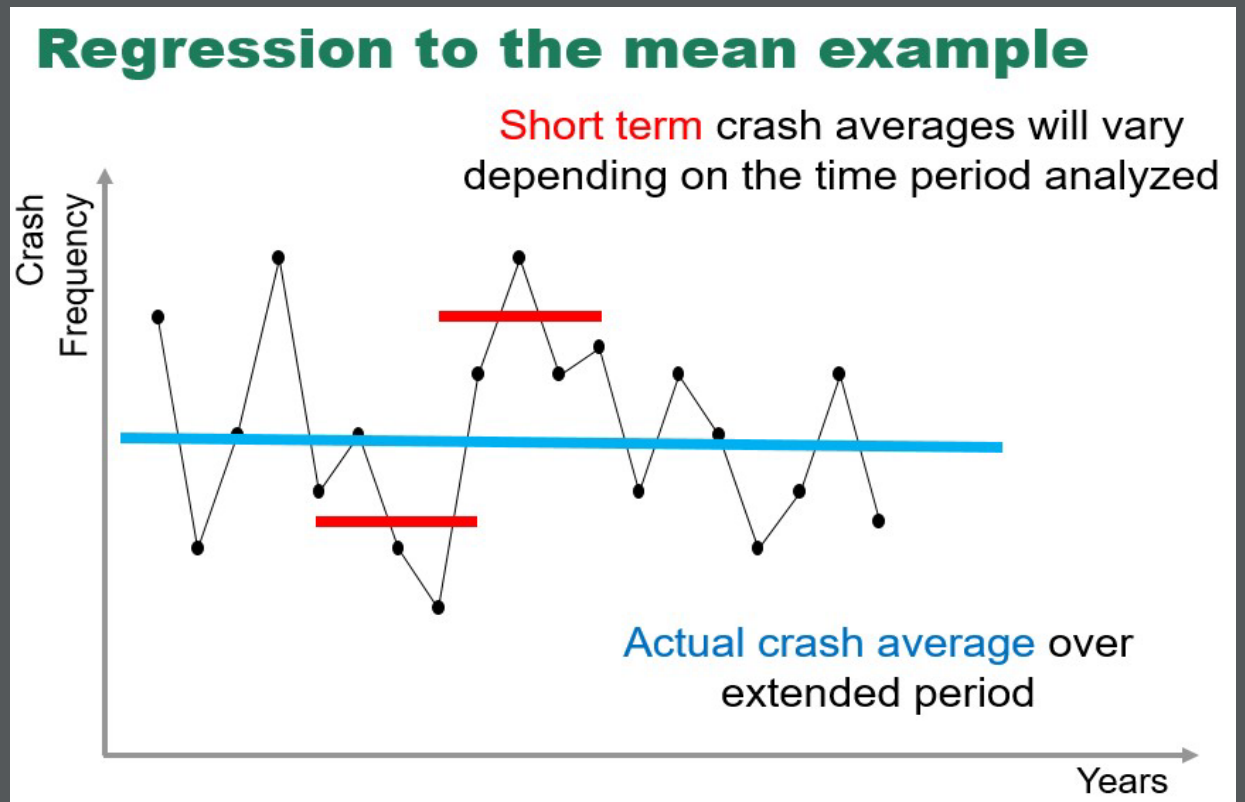

KSI or KA = Killed or Serious Injury

Sample Size = number of reported crashes

Regression Towards the Mean

Crash Data Limitations:

- Reporting rates
- Reporting errors
- Reporting bias

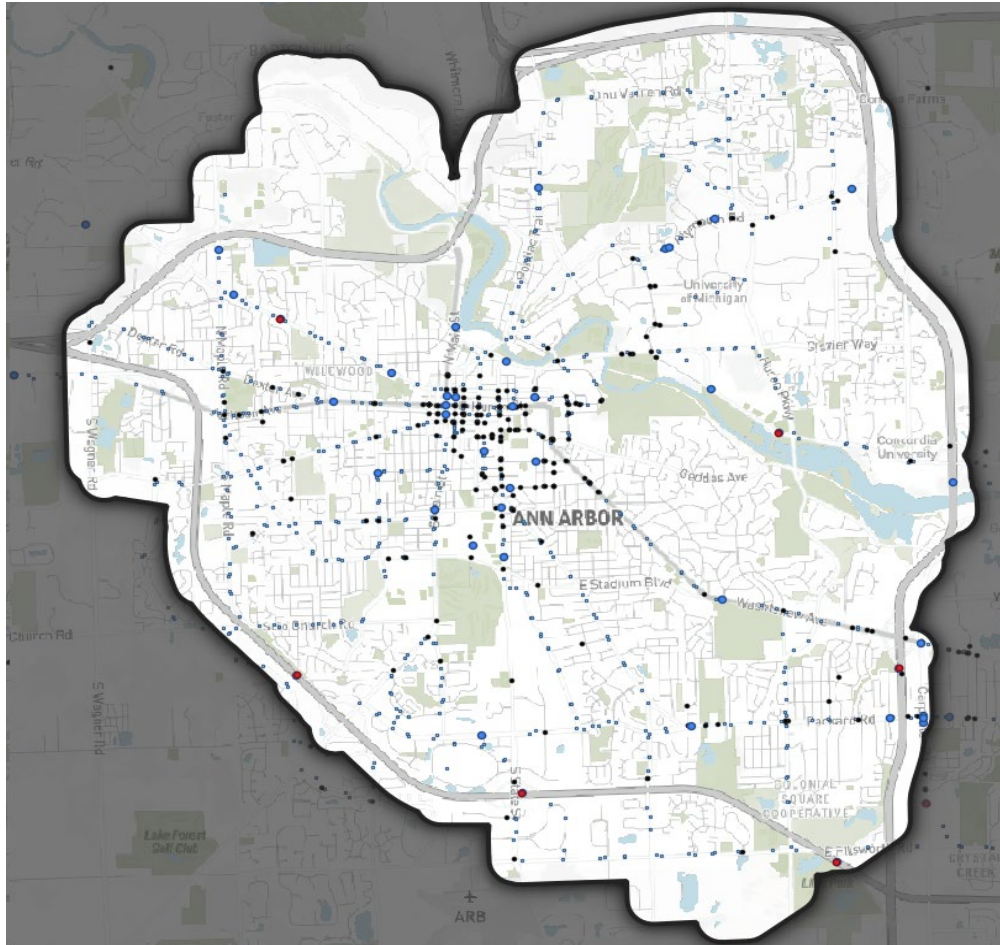

**Who?**

# Victims/Drivers Characteristics

---

## Citywide Stats

## Focus Area Stats

# Victim Age

---

| Citywide  | Focus Area  |
|---|---|
| <ul style="list-style-type: none"><li>• Overrepresented Pedestrian Victims by age cohort<ul style="list-style-type: none"><li>• 20-29</li><li>• 50-59</li></ul></li><li>• Overrepresented Pedestrian KSI Victims by age cohort<ul style="list-style-type: none"><li>• 20-24, 40-44, <b>50-54</b>, 65-69</li></ul></li></ul> | <ul style="list-style-type: none"><li>• Closely resembles citywide trend</li><li>• 20-29 and 50-59 aged pedestrians are the most overrepresented age cohorts.</li></ul> |

# Driver Age

---

## Citywide

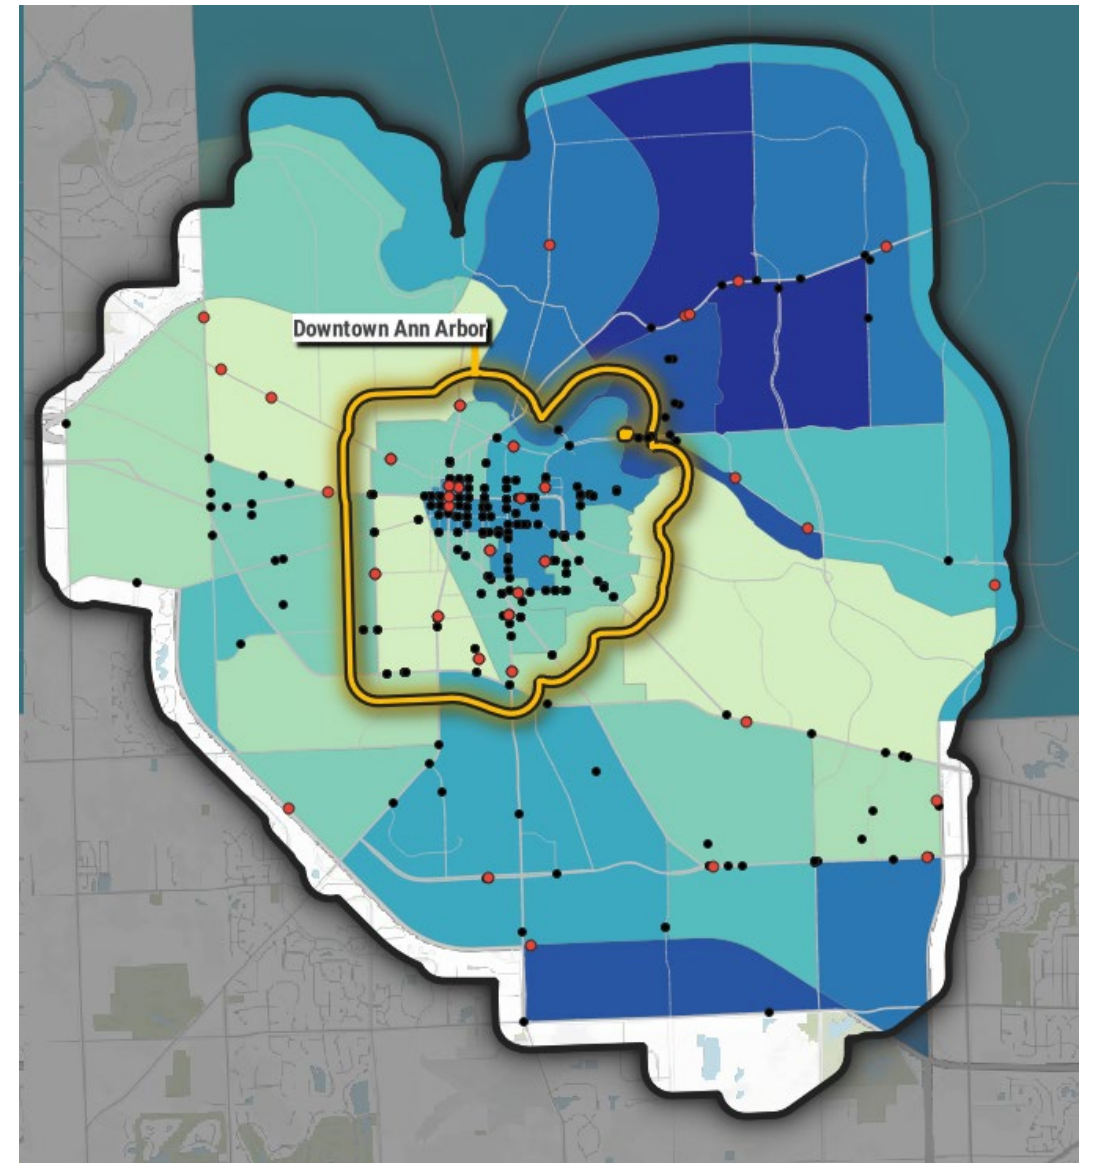

- Overrepresented Drivers by age cohort
  - 20-44
- Overrepresented Drivers involved in Pedestrian KSI crash by age cohort
  - 20-39

## Focus Area

- Drivers aged between 35-64 are the most overrepresented age cohort involved in pedestrian crashes
- Drivers aged between 25-29 and 45-54 are most overrepresented in fatal or serious injury crashes
- Departure from citywide statistic

# Communities of Color

- Not strongly associated
- Majority of crashes occurred downtown and near University of Michigan

# CDC Social Vulnerability Index\*

- Crashes mostly distributed throughout Social Vulnerability Index.

\*Refers to the potential negative effects on communities caused by external stresses on human health. Such stresses include natural or human-caused disasters, or disease outbreaks.

# CDC Minority Language

- Areas with a greater share of non-English speaking community members have a higher frequency of crashes

# Key Takeaways

---

- Pedestrians aged 20-29 and 50-59 overrepresented, particularly 50-54 citywide.
- Drivers aged 20-44 years are overrepresented citywide; focus area drivers older.
- Areas with a higher share of non-English speaking community members have a higher frequency of crashes.

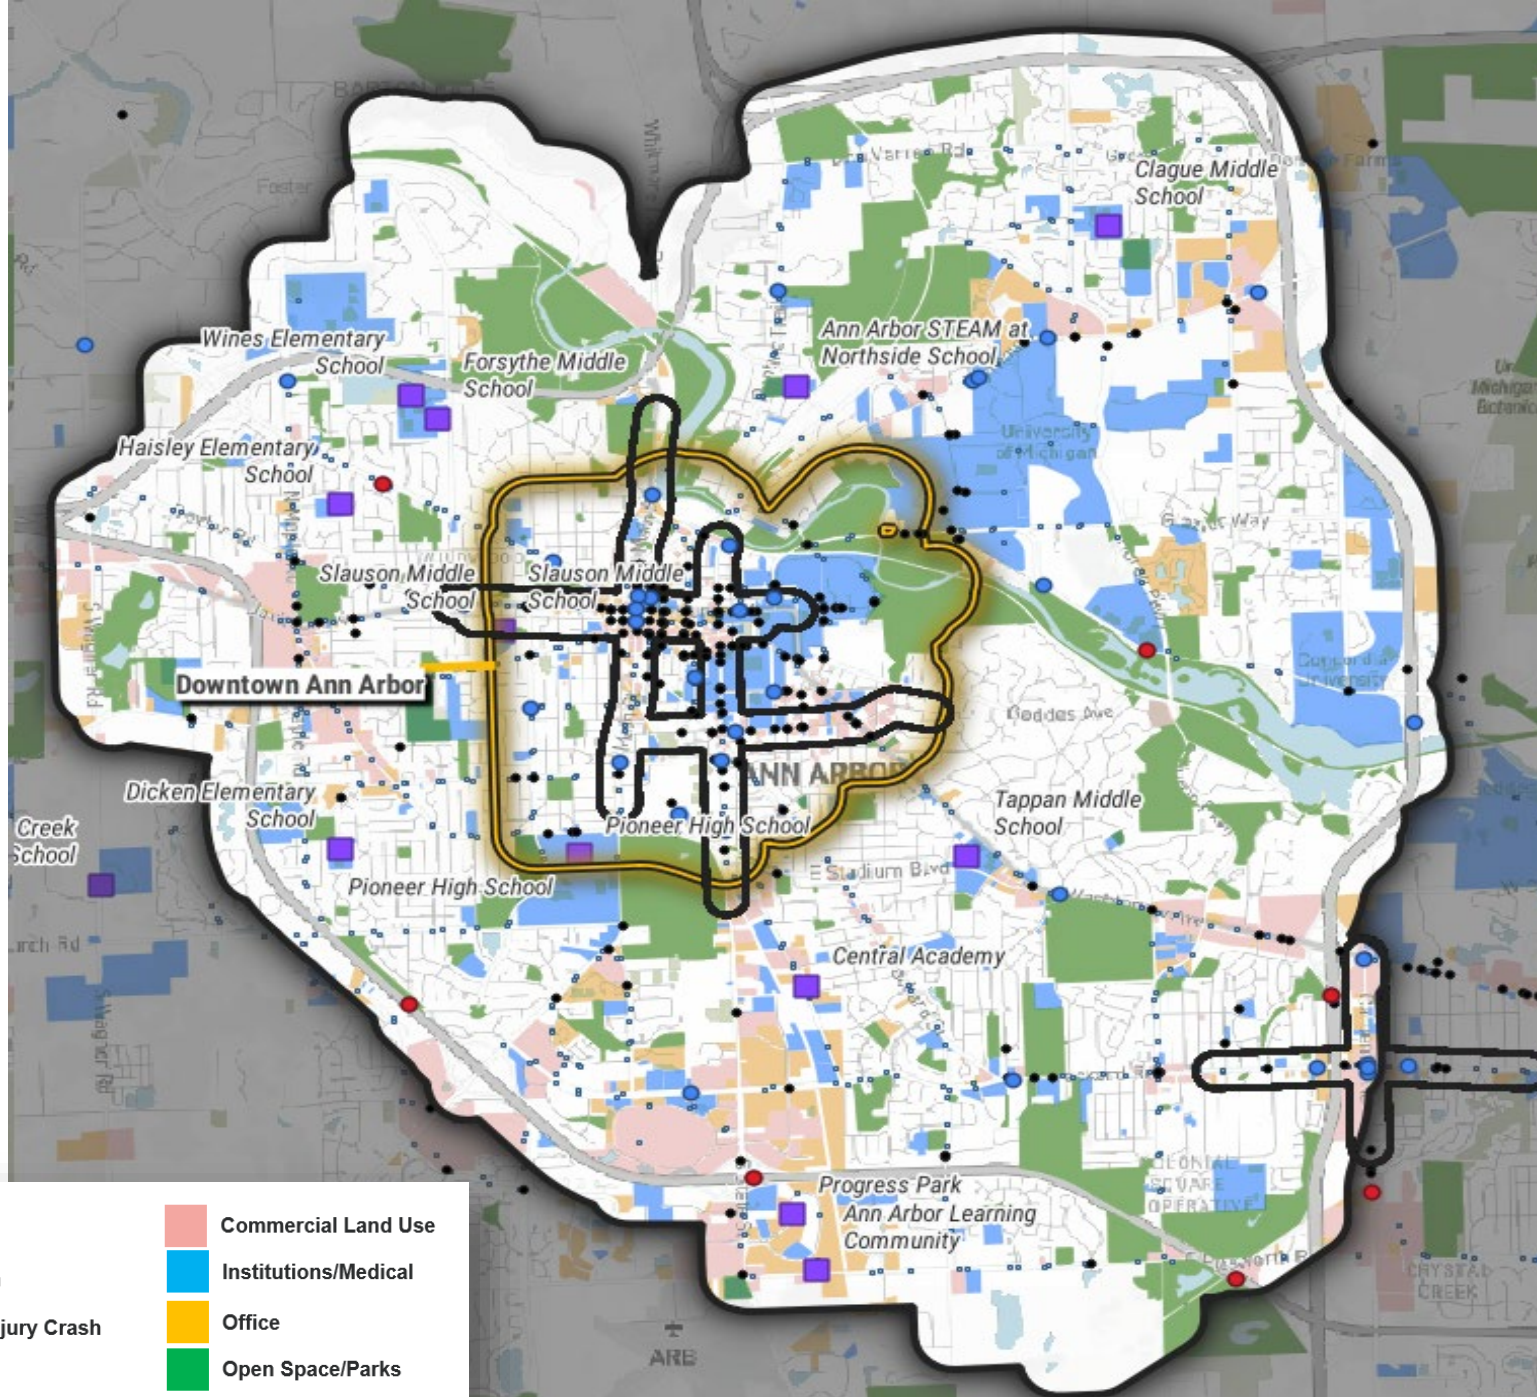

***Where?***

*Where did these crash occur?*

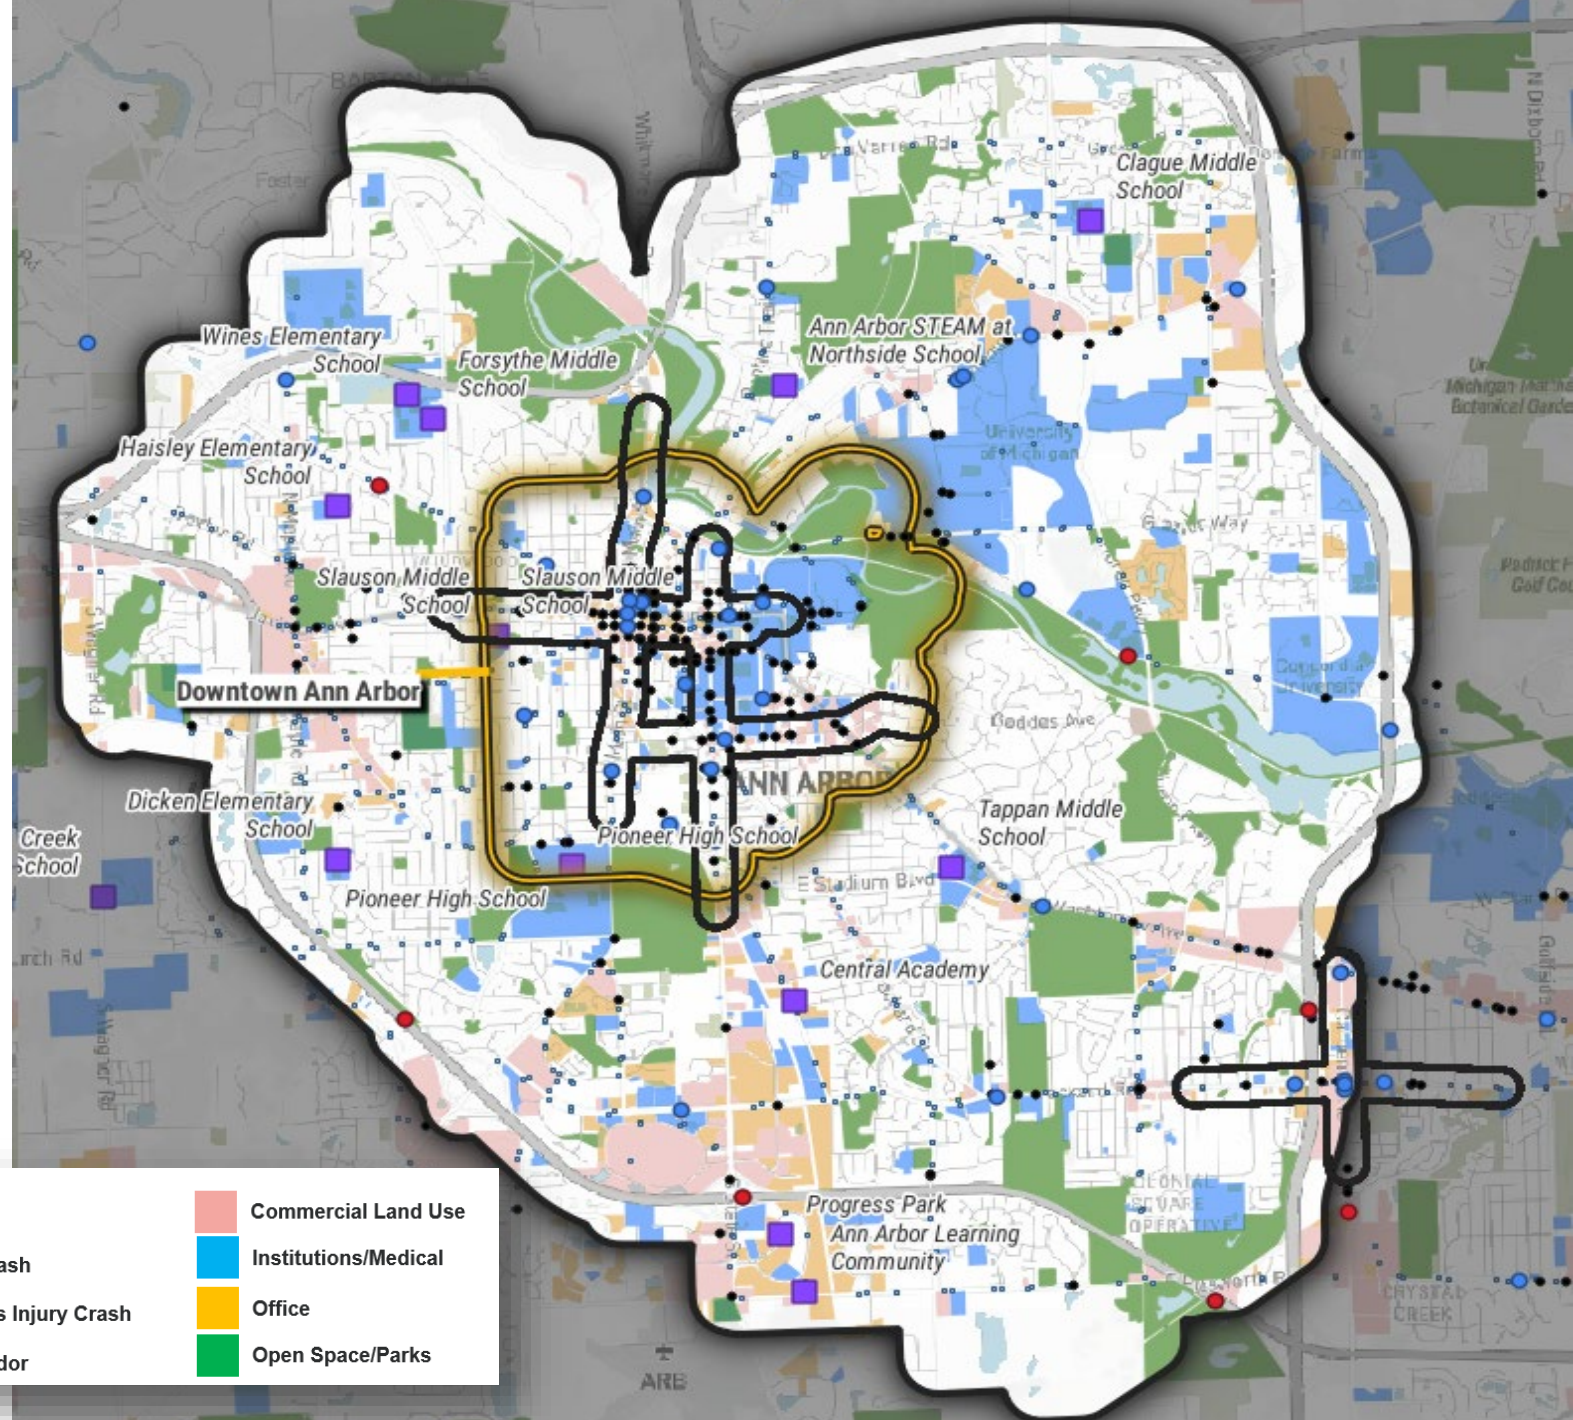

# Land Uses

- Trip generating/attracting land uses
- Commercial corridors
- University of Michigan
- Transit stops

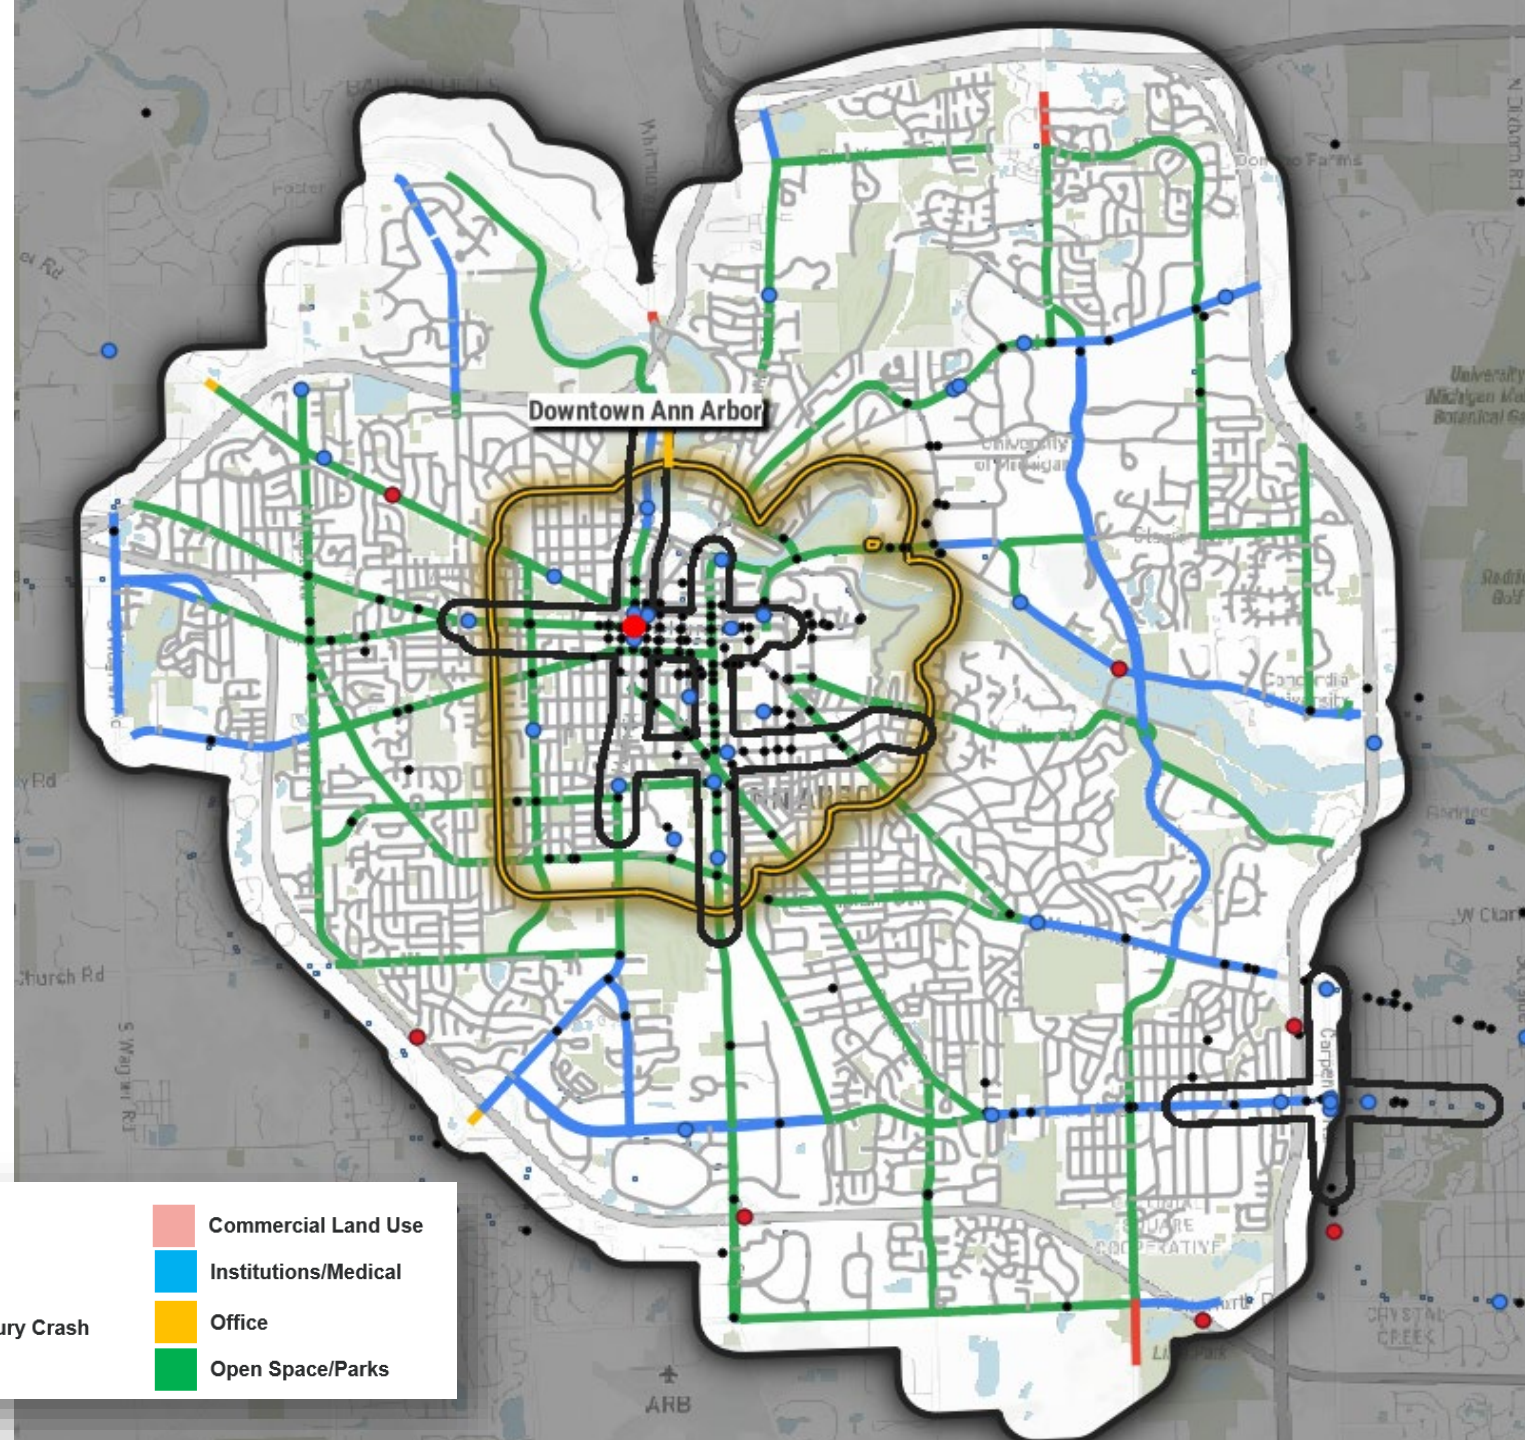

# Transit

- Inside the focus area, a higher share of crashes occurred at bus stops.

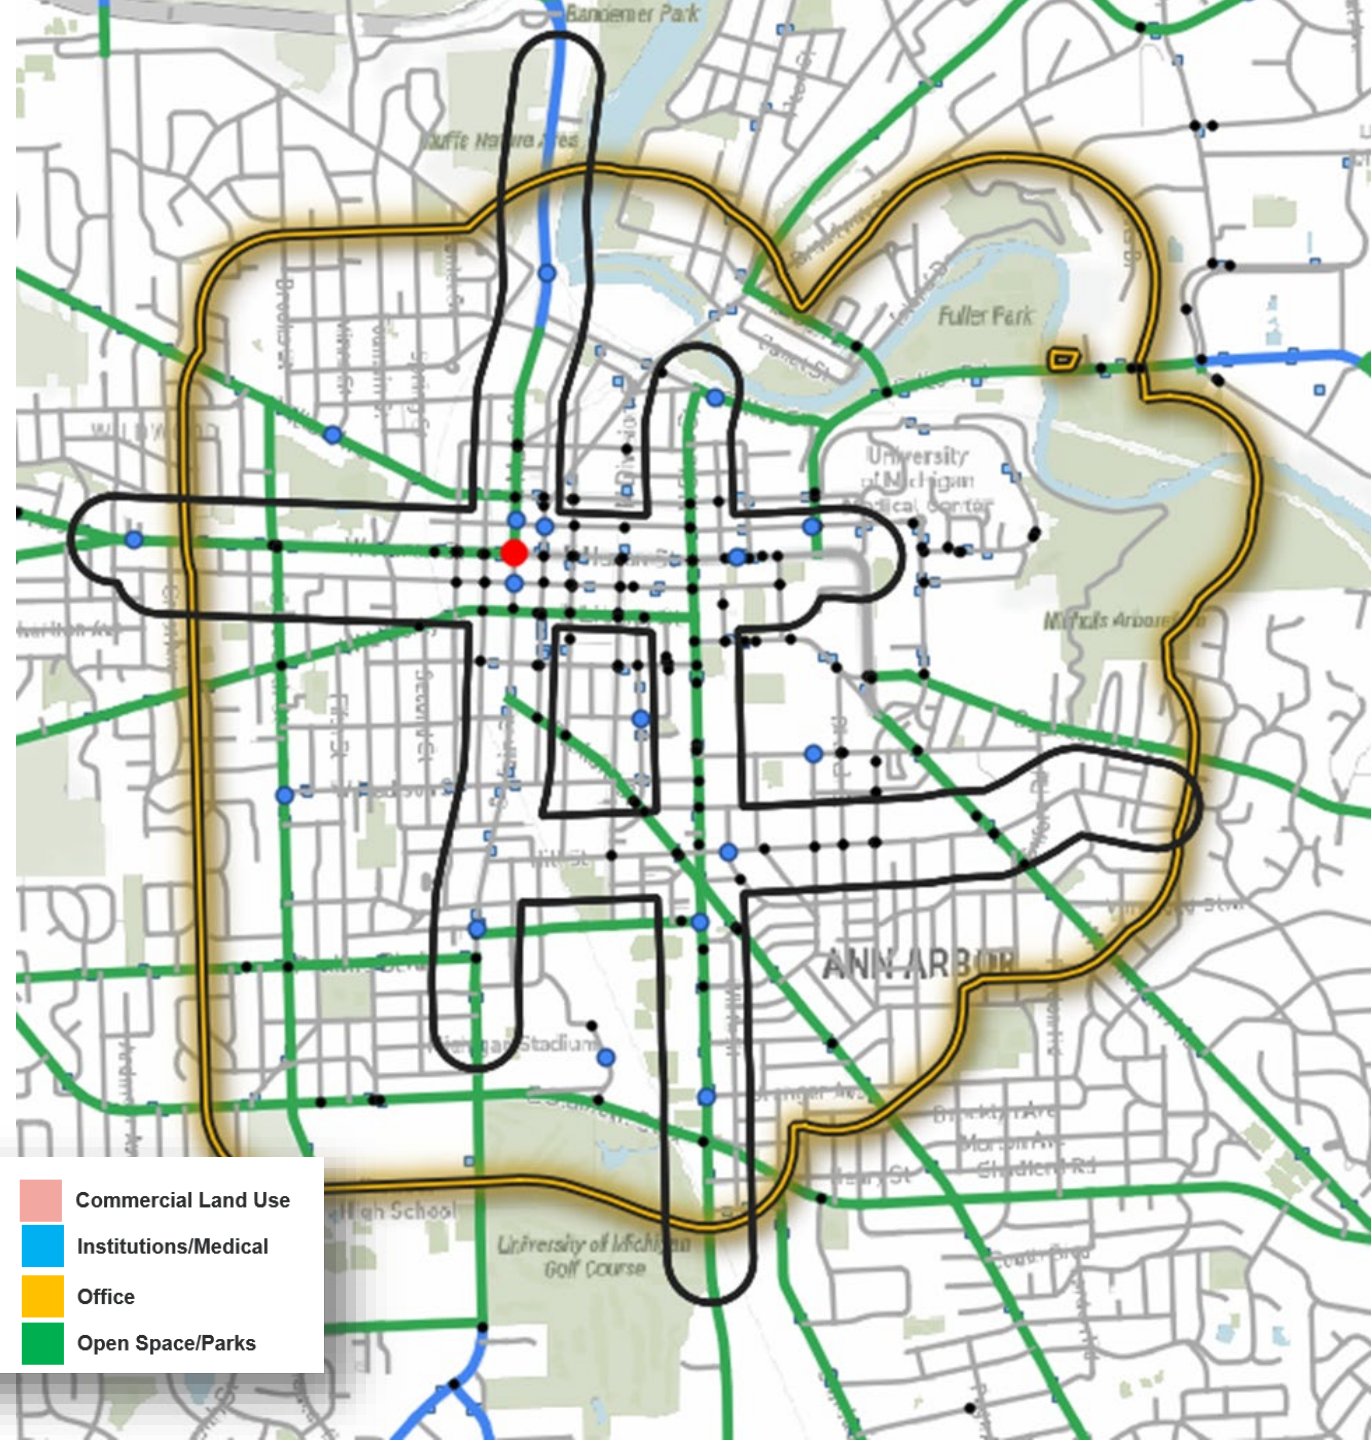

# Road Speed— Citywide

- Higher crashes per mile on higher speed roads.
- More total crashes on lower speed roads but very low crash rate per mile.

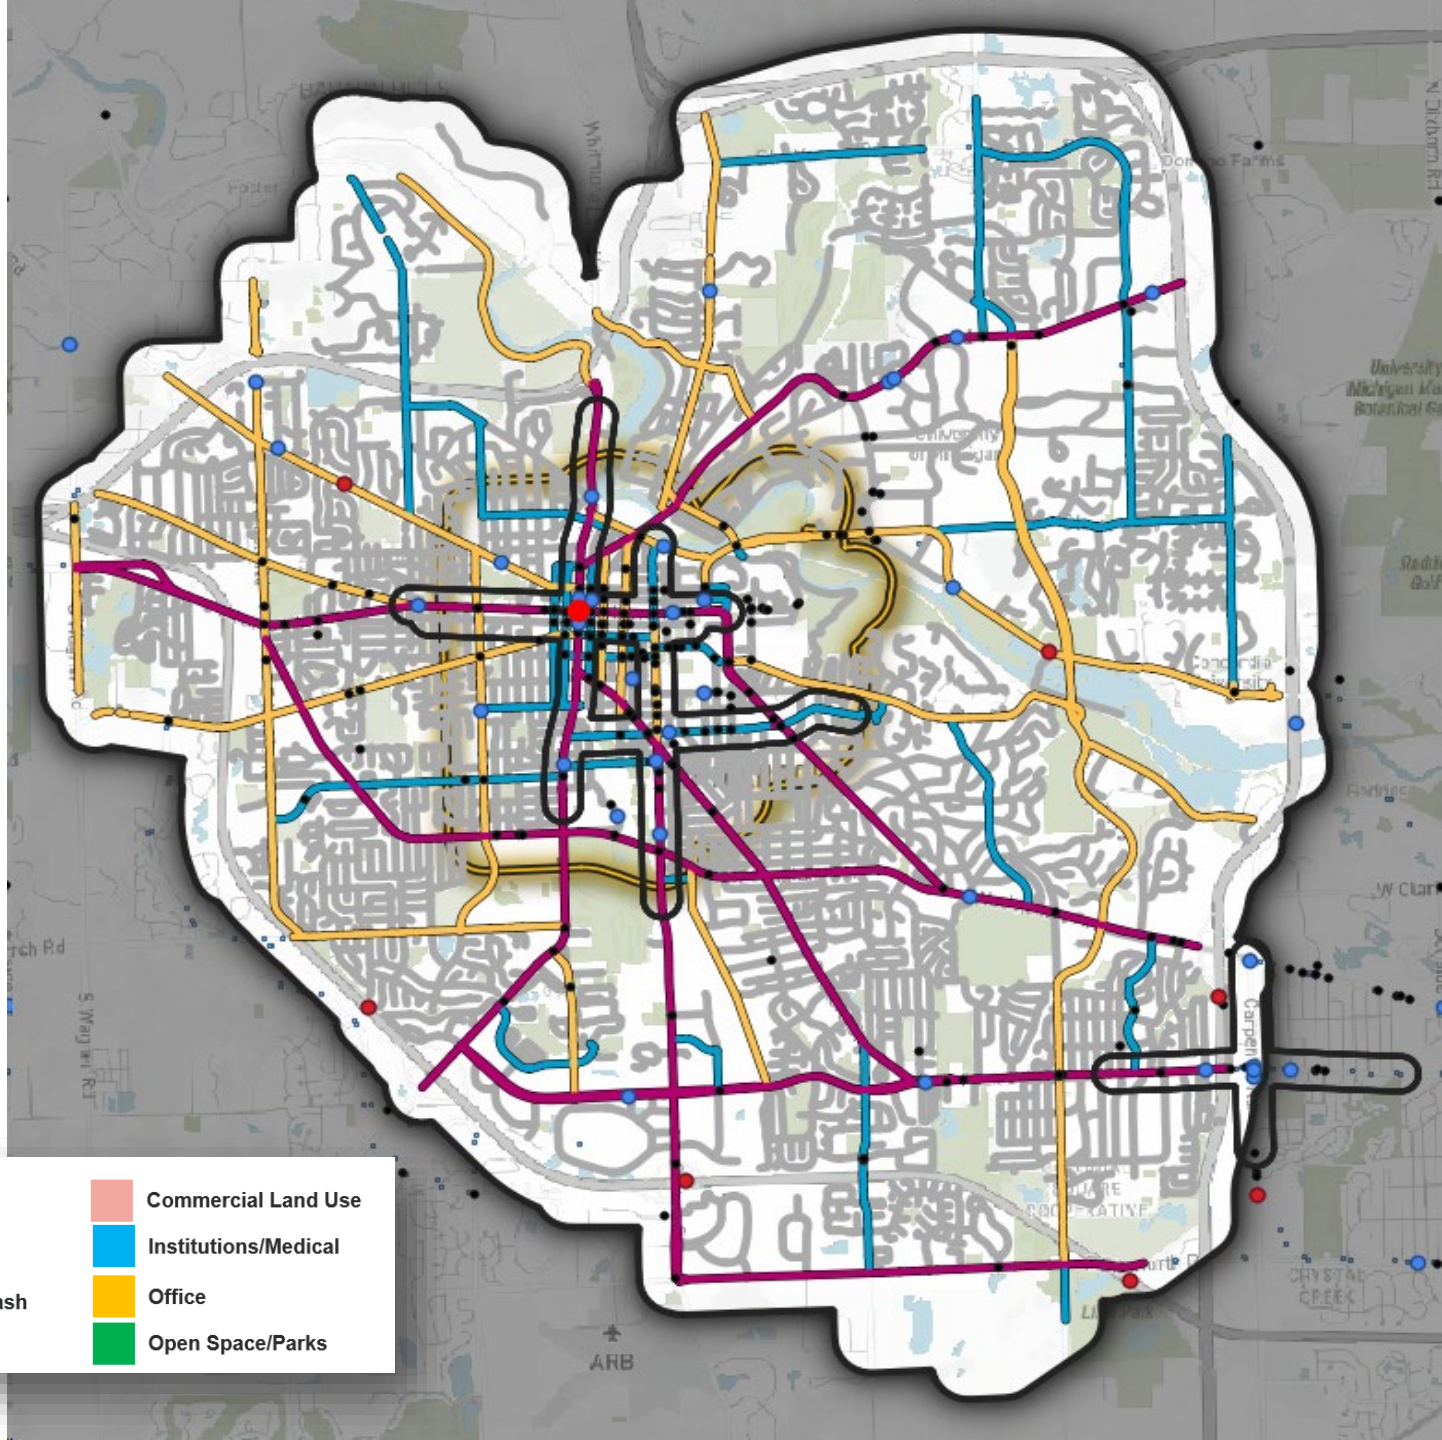

# Road Speed—Focus Area

- Higher crashes per mile on higher speed roads.
- More total crashes on lower speed roads but very low crash rate per mile.

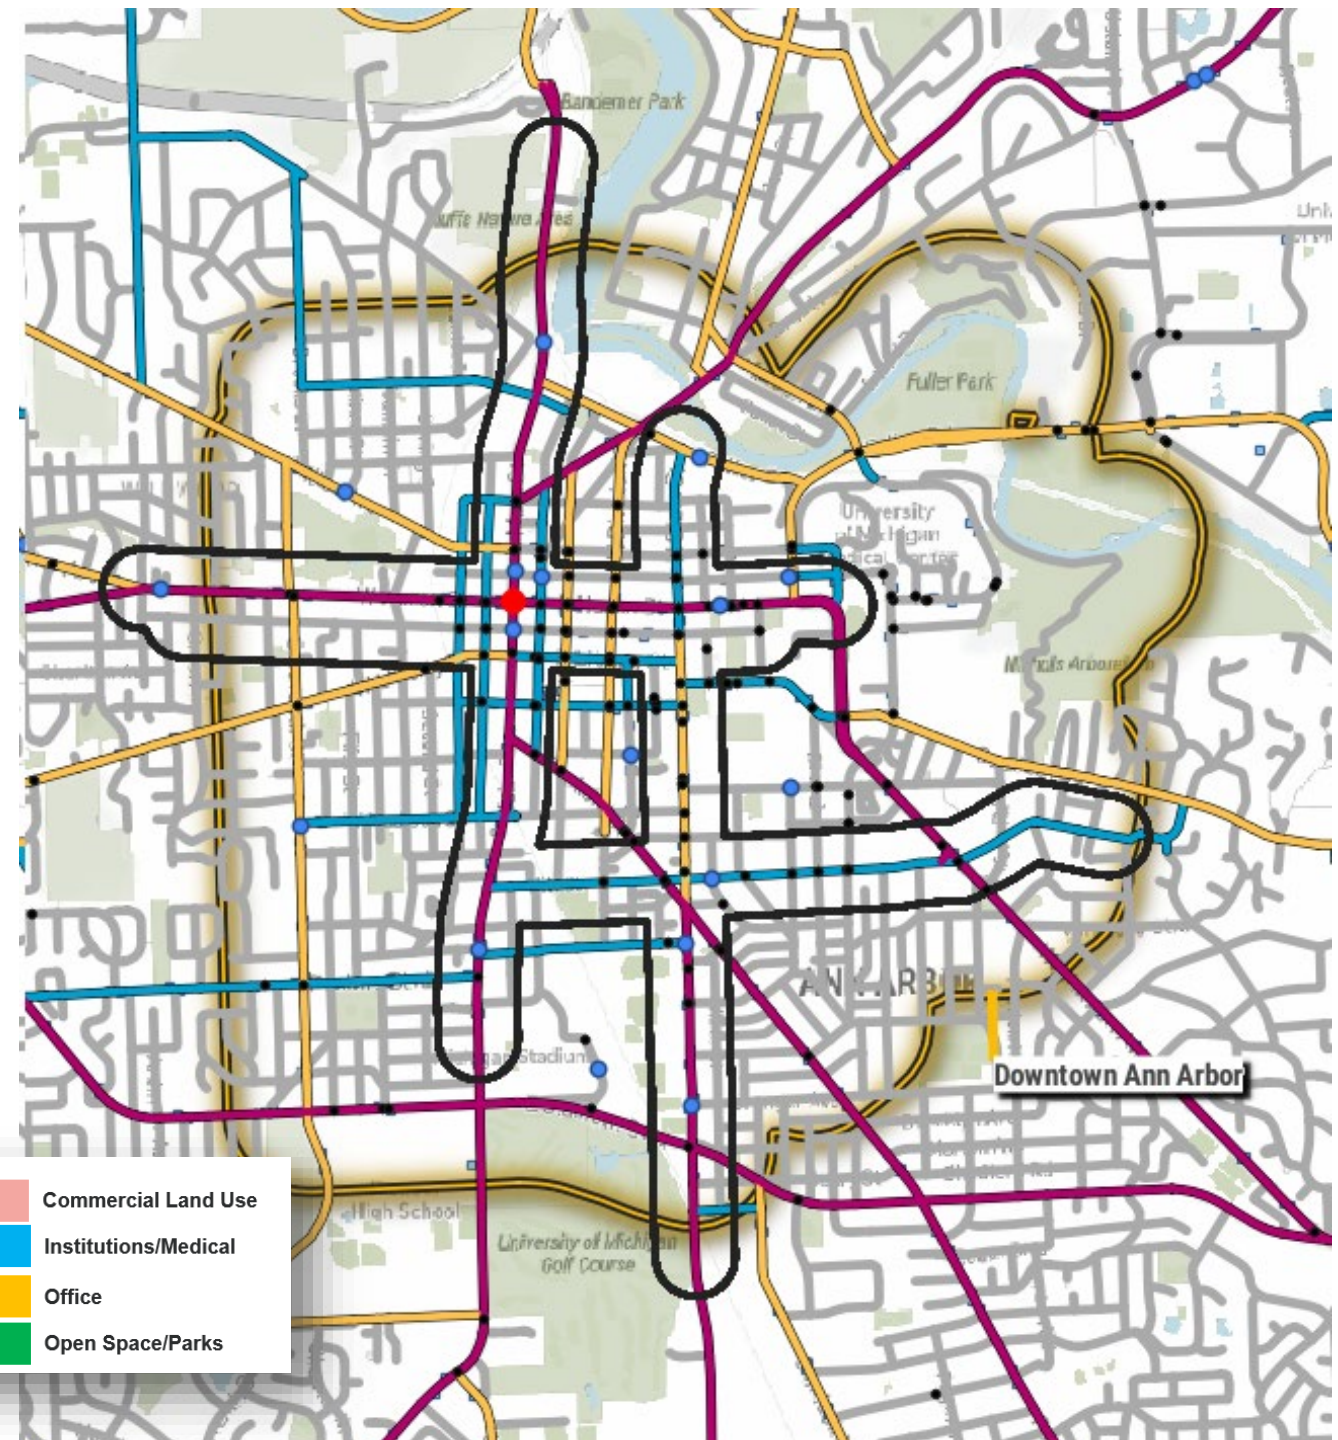

# Arterials—Citywide

- Largest share of crashes
- Highest rate of crashes per mile

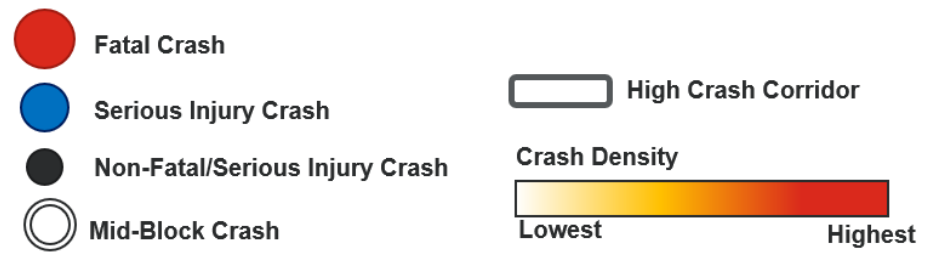

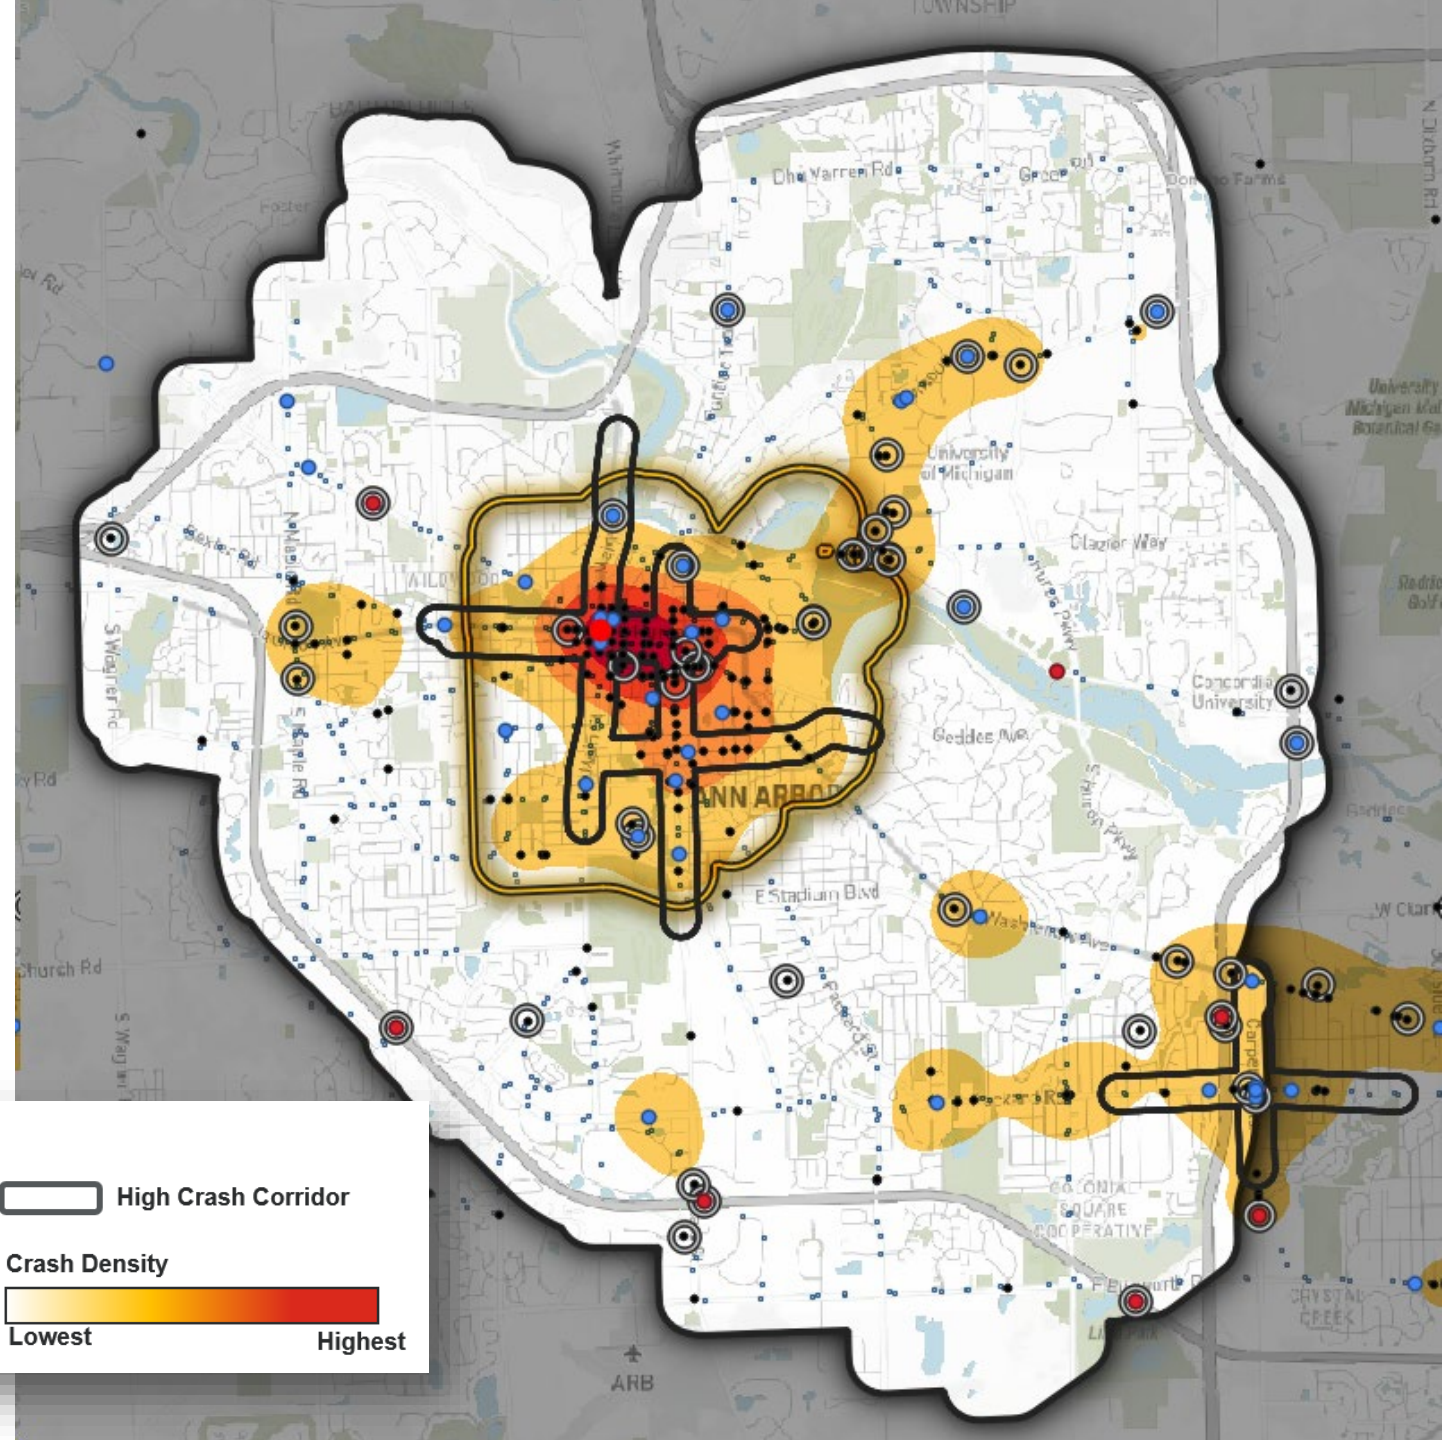

# Arterials—Focus Area

- Largest share of crashes
- Highest rate of crashes per mile

# Intersections— Citywide

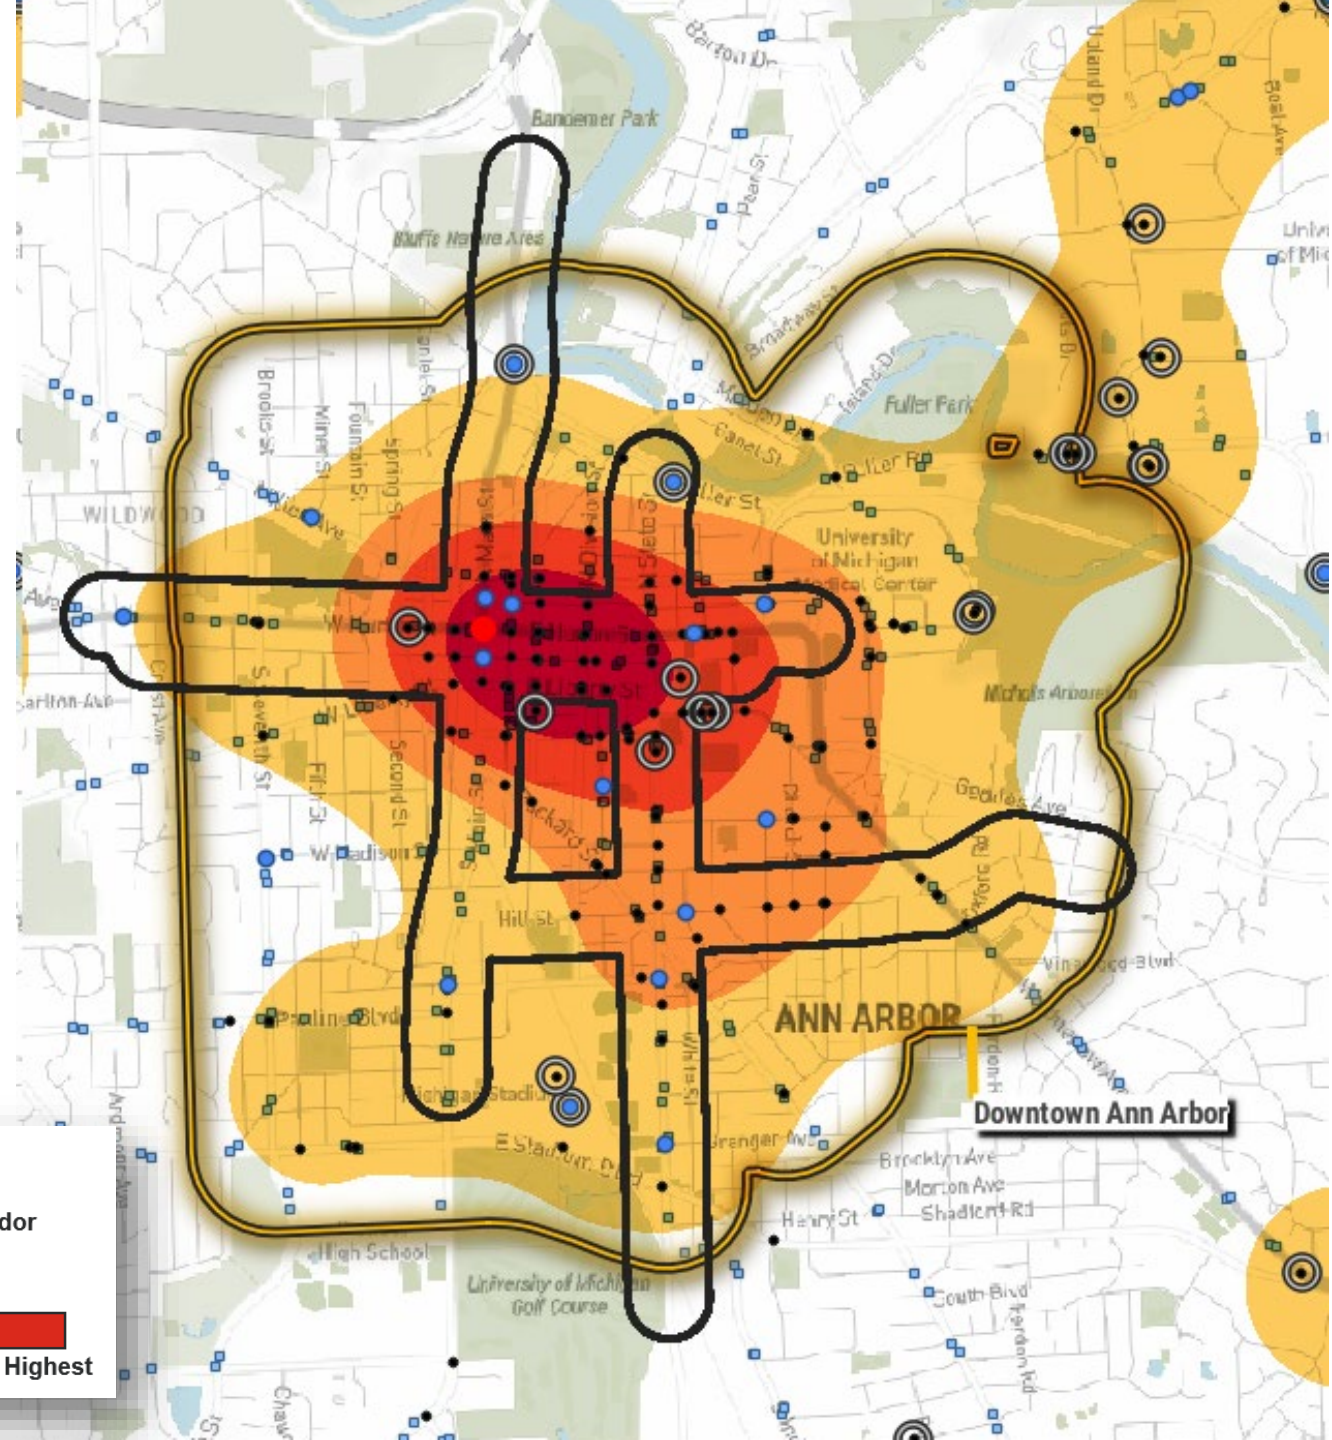

- Intersections had the largest share of crashes
- Signalized intersections – most common control type

# Intersections— Focus Area

- Intersections had the largest share of crashes
- Signalized intersections – most common control type

# Key Takeaways

---

Pedestrian crashes more likely:

- Near land uses that attract or generate pedestrians
- On high-speed, arterial roads
- At intersections

***When?***

*When did these crashes occur?*

# Time of Day, Day of Week

---

| Citywide   | Focus Area   |
|--|--|
| <ul style="list-style-type: none"><li>• AM/PM commute periods</li><li>• Weekdays</li></ul> | <ul style="list-style-type: none"><li>• AM/PM commute periods</li><li>• Weekdays</li></ul> |

# Lighting Condition

| Lighting Condition | # Crashes  | % Crashes   | # KSI     | % KSI       | % Crashes        |
|--------------------|------------|-------------|-----------|-------------|------------------|
|                    |            |             |           |             | Resulting in KSI |
| Daylight           | 102        | 47%         | 6         | 35%         | 6%               |
| Dark-Lighted       | 85         | 39%         | 10        | 59%         | 12%              |
| Dark-Unlighted     | 12         | 6%          | 1         | 6%          | 8%               |
| Unknown            | 7          | 3%          | 0         | 0%          | 0%               |
| Dusk               | 6          | 3%          | 0         | 0%          | 0%               |
| Dawn               | 4          | 2%          | 0         | 0%          | 0%               |

| <b>Grand Total</b> | <b>216</b> | <b>100%</b> | <b>17</b> | <b>100%</b> | <b>8%</b>                  |

# Key Takeaways

---

Pedestrian crashes more likely:

- On weekdays, during AM/PM commute periods
- In dark conditions
- During times of year when school is in session

***Why?***

*Why or how did these crashes occur?*

# Reported Violations— Focus Area

- Very few alcohol (0 driver, 5% ped) and no drug related crashes
- Few reported distracted crashes (6% driver, 2% ped)
- Majority reported contributing factors were driver failed to yield (62%)
- 2/3 of crashes related to motorists not yielding, disregarding traffic control device, or other risky driving behaviors
- 14% hit-and-run crashes

# Pre-Crash Movements— Focus Area

- Left turn crashes (43%) and straight crashes (41%) are the most frequent
- Left turn crashes occurred most often at signalized intersections along Huron St, Main St, and Glen Ave.
- Right turn crashes are concentrated at intersections along collector or local streets.
- Going straight crashes occurred generally along minor arterials and collector streets. Concentrations within or near University campus.

● Going Straight

● Left Turn

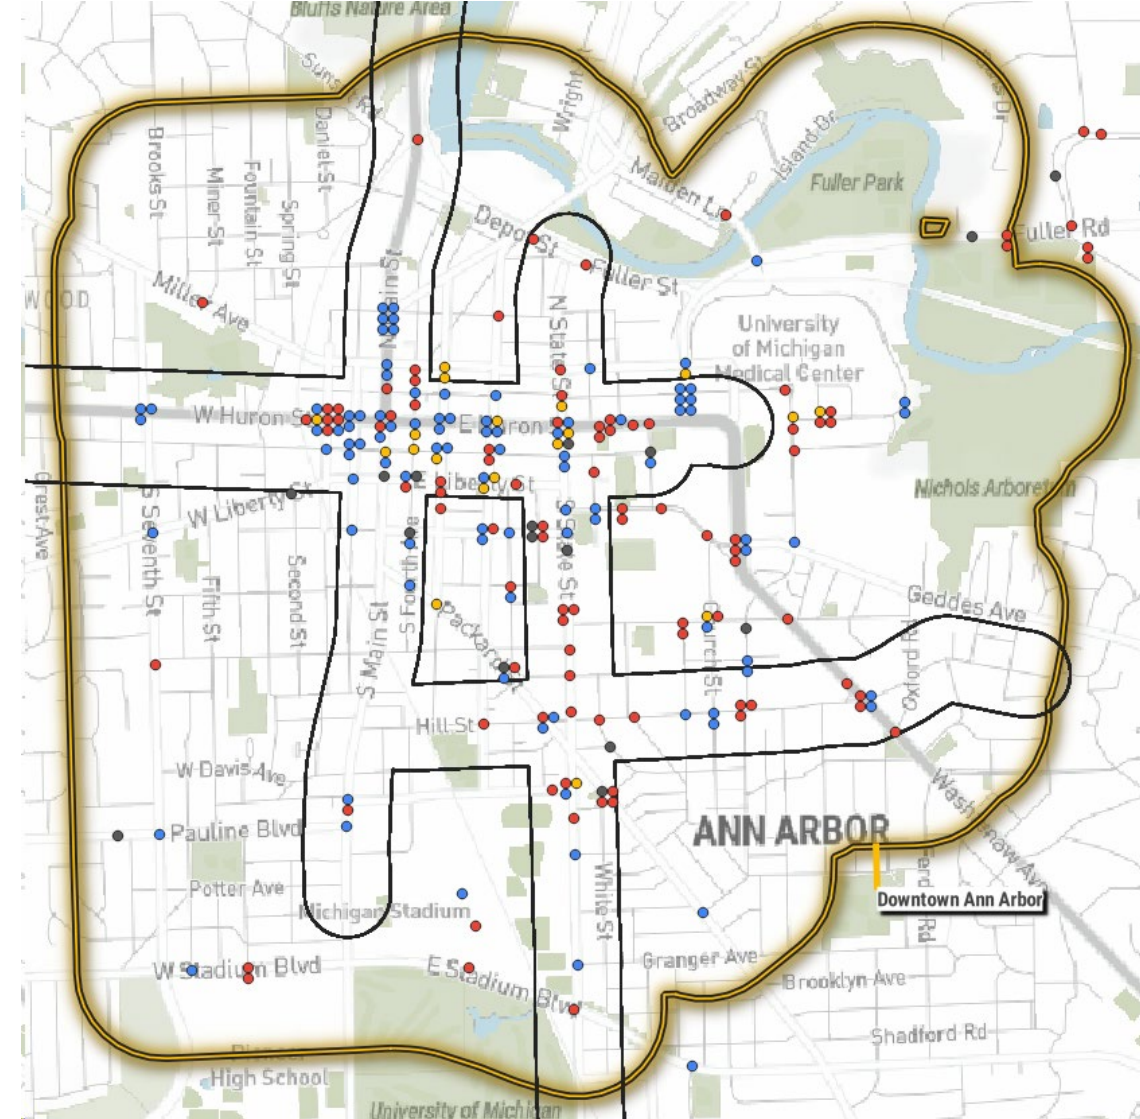

● Right Turn

● Unknown

▭ High Crash Corridor

# Pre-Crash Movements— Focus Area

- Most crashes involved a pedestrian crossing the street
  - Largely at signalized intersections
- Few crashes involved a pedestrian walking along the side of a road or crossing a driveway

● Going Straight

● Left Turn

● Right Turn

● Unknown

▭ High Crash Corridor

# Key Takeaways

---

- Driver failure to yield is the most reported contributing factor.
- Left turn crashes and straight are most frequent.
- Most crashes involve a pedestrian crossing the street.

# *Discussion*

# Discussion Questions

---

- Do you have any questions about the crash analysis done for this project?
- Is there anything in the crash analysis that surprises you?
- Is there anything in the crash analysis that seems to be missing?
- What do you believe are the top pedestrian safety issues in Ann Arbor?
- What audiences do you think are particularly important to connect with through the Ann Arbor pedestrian safety education campaign?

**Thank you!**
